- LA English
- AB Cellulose-based resins are versatile high-loading resins that may easily be derivatized to give a variety of functional groups suitable for applications in polymer-assisted soln. phase synthesis. This technique involves the sequestration of either product or excess reagents or byproducts from a reaction mixt. using an insol. polymer. Purifn. can be achieved by simple filtration and evapn. This, Perloza MT-100 was modified to give cellulose 3-bromo-2-hydroxypropyl ether and cellulose 3-[[2-[(2-aminoethyl)amino]ethyl]amino]-2-hydroxypropyl ether. A mixt.

of
 alkene in anhyd. dichloromethane was added to a soln. of bromine
 in dichloromethane until a yellow color persisted. After 30 min
 cellulose 3-bromo-2-hydroxypropyl ether was added and the mixt. became
 decolorized. For example, the bromination of styrene gave
 (1,2-dibromoethyl)benzene in 95 % yield and in high purity.

DE 1990-4021712 19900707

In the title process, which avoids the addn. of H2O, the polyamine mixt. is phosgenated in the presence of polyoxyalkylene alcs. Heating a mixt. of crude methylenedianiline (4,4'- 50, isomers 4.04, and polynuclear homologs 45.96%) 10, excess COCl2 8, and PhCl 82 parts and 5% glycerol polyethyene-polypropylene glycol ether (I) (based on crude diamine) at 100-140.degree. for .apprx.20 min, distg. excess COCl2, cooling to 100-120.degree., and distg. PhCl in vacuo gave a polyisocyanate with I color no. 50, NCO content 30.7%, and viscosity 66 mPa-s; vs. 90, 32.1, and 50, resp., in the absence of I.

AB The prepn. of MDI mixts. and PAPI by phosgenation of the corresponding amines in an inert solvent at high temps. is characterized in that the reaction mixt. after phosgenation, in the presence or absence of **phosgene**, is combined with a mixt. of water and .gtoreq.1 mono- or multifunctional polyoxyalkylene alc. or mixts. of alkoxylated alcs.

After

addn. of the alkoxylated alc. and water mixt., the excess, esp. the residual, **phosgene** and inert solvent are removed, 0-5% phenolic or aryl phosphite antioxidant is added, and the reaction mixt. is treated thermally. Thus, an isomeric mixt. of methylenediphenylene diisocyanates was heated to 130-140.degree. and combined with water and a polypropylene glycol (hydroxy no. 250); the reaction mixt. was heated at 175.degree.

and

the residual **phosgene** and chlorobenzene solvent was distd. The mixt. was dechlorinated to give raw MDI having **iodine** no. 25, total Cl content 1900 ppm, and **isocyanate** content 31.5%.
